
$p^*_i = \text{clip}(x_i - \lambda^*, l_i, u_i)$

$\lambda^* > 0$ solves $\Sigma_i \text{clip}(x_i - \lambda, l_i, u_i) = \tilde{C}$

(here: one EV clipped at u_1, one free)

$\lambda^* = 0$ if clip(x, l, u) is already in $\mathcal{K}$(t)
